The art of everyday living begins here.

Campaign Scheduling Plan

How the Klaviyo campaign scheduler works, the June send schedule, and the cited safe re-warm sequence for a dormant list.

Drafts only.

Brand Purry Home

Market United Kingdom

Prepared by Email + Creative Strategy

Period June 2026

Purly Home · Klaviyo · June 2026 — how the campaign scheduler works, the full send schedule, and the **cited, safe re-warm sequence** for a list that has been dark for ~6 months. Drafts only; a human clicks Send. Re-warm guidance below is sourced from Klaviyo's own docs + ICO guidance (see §7).

1 • The headline

Purly's **broadcast channel has been dormant ~6 months** (0 campaigns in 90 days; only flows firing). The machinery to stage and schedule campaigns the same way as Aster is now in place — but *how* we switch it back on matters more than *that* we do. Lifecycle-flow unsubscribe is already running hot at **1.9–2.7%** — far above the <0.3% Klaviyo health floor — which is the warning light that says: re-warm gently, most-engaged audience first, widen only as deliverability holds.

Klaviyo classifies this as **ramping** (re-establishing reputation on an existing account), not warming from zero — so reputation should recover faster than a brand-new domain. But inbox providers take **up to 30 days** to form a reputation decision, so this is a multi-week ramp, not a one-week switch.

2 • How the scheduler works

A deliberate **two-phase model**. Phase 1 is safe and automated; Phase 2 is human-gated.

| Phase 1 — STAGE (automated, no email goes out)

A driver reads each built HTML template and runs this pipeline through `scripts/klaviyo.py`:

```
read templates/<file>.html
→ create_template(name, html)                → template_id      [POST /api/templates]
→ create_campaign_draft(name, subject,        → {campaign_id, message_id}
  preheader, audience_id, audience_kind)      [POST /api/campaigns → status = draft]
→ update_campaign_send_time(campaign_id,      → send_strategy = static datetime
  "2026-06-09T19:00:00+01:00")
→ assign_template_to_message(message_id,      → SNAPSHOTS the HTML into the message
  template_id)                                [POST /api/campaign-message-assign-template]
```

Result: **N campaigns sitting in Klaviyo as Drafts**, each with audience, subject, preheader, send time and rendered HTML — ready for review. Nothing has been sent.

| Phase 2 — SCHEDULE / SEND (explicit human go)

A draft goes live only when its send-job fires:

- **Normal path:** open in the Klaviyo UI, review, click **Schedule / Send**.
- **API path:** `schedule_campaign(campaign_id)` → `POST /api/campaign-send-jobs` (async, returns HTTP 202). Status is polled via *Get Campaign Send Job* (queued → processing → complete); *Update Campaign Send Job* can cancel/revert to draft before send. Flagged **explicit-go only** — no staging/rebuild script ever calls it.
- **Backstop:** the hard `send_guard()` aborts any accidental send path.

| Gotchas confirmed by the research

1. **Template snapshot is mandatory and frozen.** A campaign cannot be scheduled until a template is assigned to its message. Assigning *clones* the template into a non-reusable copy bound to the message —

- later edits to the original do **not** propagate. So: finalise HTML and **run the link-checker BEFORE assigning**, and `assign` is always the last step. `refresh_campaign_messages()` re-snapshots after any edit.
2. `smart_send_time` is **NOT available to us**. Klaviyo's Smart Send Time / send-time-optimisation requires an audience of **12,000+**; Purry is ~1,800. We schedule with **static datetime** (`is_local` controls per-recipient-timezone vs. one absolute moment). `throttled` (a % of recipients over time) is the useful safety valve when we later widen to the full list.
 3. **Send-time bounds**. Static datetime accepts *past* times on a Draft (you reschedule in the UI) but rejects datetimes >~1 year out — hence the near-future placeholder set at create, then overwritten with the real slot.
 4. **Pin the API revision**. Behaviour above is confirmed for revision `2024-10-15` (what `klaviyo.py` sends). Klaviyo's newer default `2026-04-15` renames the scheduling endpoint (`campaign-message-schedule`) — don't bump the header without re-checking.

3 · The schedule — June calendar (as authored)

All times **UK / Europe-London (BST = +01:00)**. Mix: **4 editorial · 8 commercial** (VIP held = 13th send). *The audiences below are the calendar's original intent; §5 overrides them with the safer re-warm ramp.*

#	Date (2026)	Time	Type	Template	Subject (variant A)
1	Sun 1 Jun	10:00	Editorial · Problem-aware	06-01-editorial-problem-aware	Living room feels flat? It's the light.
2	Tue 3 Jun	19:00	Commercial · Floor lamps	06-03-commercial-floor-lamps	Floor lamps: warm, quiet, strong.
3	Thu 5 Jun	19:00	Commercial · Outdoor	06-05-commercial-outdoor	Long evenings, the right light
4	Sat 7 Jun	11:00	Commercial · Bestseller	06-07-commercial-bestseller	The 5 lamps everyone saves
5	Tue 9 Jun	19:00	Editorial · 2700K vs 4000K	06-09-editorial-mechanism	2700K or 4000K? It changes everything.
6	Thu 11 Jun	19:00	Commercial · Table lamps	06-11-commercial-table-lamps	Table lamps for quiet evenings
7	Sat 13 Jun	11:00	Commercial · Pendants	06-13-commercial-pendants	The light over the dining table
—	Tue 16 Jun	19:00	Commercial · VIP	HELD — no template yet	Just for our regulars
8	Thu 18 Jun	19:00	Editorial · 5 mistakes	06-18-editorial-5-mistakes	5 mistakes with living-room light
9	Sat 20 Jun	11:00	Commercial · Solstice	06-20-commercial-solstice	The longest evening of the year
10	Tue 23 Jun	19:00	Commercial · Ceiling	06-23-commercial-ceiling-lights	Ceiling lights without office glare
11	Thu 25 Jun	19:00	Editorial · Founder	06-25-editorial-founder	Hi, I'm Akshit.
12	Sat 27 Jun	11:00	Commercial · Month-end	06-27-commercial-monthend-placeholder	What landed best in June

Two flags: today is **8 June**, so sends 1–4 are already past — the live schedule starts at **#5 (Tue 9 Jun)**; the past four are skipped or re-dated (owner decision). **VIP (Jun 16) is held** with no template, exactly as Aster

held its Tue-16 VIP, waiting on the exclusive code.

4 • Audiences

Audience	Klaviyo ID	Size	Role in the ramp
engaged_30d (segment)	to be created	TBD (likely small)	Weeks 1–2: the ONLY audience
engaged_60d (segment)	to be created	TBD	Weeks 3–4, if signals hold
Newsletter (list)	XWSRZx	631	Widen to once engaged sends are healthy
Everyone not suppressed (segment)	WuLenC	1,798	Full reachable base — last, throttled

engaged_30d — Klaviyo's recommended definition (build this first): *can receive email marketing (subscribed) AND (Opened email ≥1× in last 30 days OR Clicked email ≥1× in last 30 days OR subscribe date in last 15 days)*. After 6 months dark this will be small — that's correct; small-and-hot is the point of a re-warm opener. Creating a segment sends nothing and is reversible.

5 • The safe re-warm sequence (the part that matters most)

Because the list has been dark ~6 months **and** flow-unsub is already at 1.9–2.7%, we do **not** stage all 12 and blast the full list. Klaviyo's own guidance: *do not contact all dormant contacts at once; start small to the most-engaged, send consistently, ramp gradually*.

The ladder (Klaviyo's published cadence, mapped to our remaining June sends)

Window	Audience	Condition to advance
Weeks 1–2 (≈ Jun 9–21)	engaged_30d only — editorials <i>and</i> commercials	Open rate holding > 20% , complaints/bounces healthy
Weeks 3–4 (≈ Jun 22–30)	widen to engaged_60d ; commercials may reach Newsletter (631)	Signals still holding
After 4 weeks (July)	engaged_90d , then the full base (WuLenC , 1,798) — throttled	Pause/step back if opens dip below 20%

This **overrides** the per-send audiences in §3 for any send made now: every remaining June send starts on engaged_30d , not the full Newsletter. The editorial-first content order is ideal re-warm fuel (value, not a sales push).

Deliverability floors — read before widening

Source: Klaviyo health benchmarks. **Click rate is the truer signal** — Apple Mail Privacy Protection inflates opens by ~18–32 pts, so don't widen on open rate alone.

Signal	Floor	Note
Open rate	≥ 33%	Inflated by Apple MPP — corroborate with clicks
Click rate	≥ 1%	Most reliable widen/hold trigger
Bounce rate	< 1.0%	Suppress prior hard-bounces before sending
Unsubscribe rate	< 0.3%	Purry's flows already breach this — watch closely
Spam-complaint rate	< 0.01%	The hardest deliverability killer

Suppress first: anyone who has previously bounced, unsubscribed, or marked spam — never include them in the re-warm.

6 • UK GDPR / PECR compliance (cited — ICO)

- **Consent is the default basis.** You normally need consent before marketing email to individuals; it must be *freely given, specific, informed*, and an *unambiguous affirmative action* — no pre-ticked boxes, silence, or inactivity.
- **Soft opt-in covers past customers.** You may email existing customers about *similar products* without fresh consent **if all hold**: details obtained directly during a sale/negotiation; marketing similar products; opt-out offered at collection; opt-out offered in *every* message. The 631 newsletter list likely relies on consent; past purchasers can be reached via soft opt-in.
- **Every email must:** not disguise the sender's identity, and carry a valid, working unsubscribe — in *every* message. (Our footer renders Unsubscribe + the UK postal address.)
- **Dormancy doesn't legally expire consent**, but it raises complaint/deliverability risk — which is exactly why we ladder engaged-first.
- **Open question:** the research did not surface an ICO statement *mandating* a postal address inside the email (that's US CAN-SPAM, not UK PECR). We keep it anyway — it's good practice and a standing brand rule — but the confirmed legal minimum is sender-identity + working unsubscribe.

7 • Sources

Authoritative, adversarially verified (24/25 claims confirmed):

- Klaviyo Help Center — list re-warming / ramping, engaged-segment definition, re-engaging an old list, deliverability health floors, Smart Send Time eligibility.
- Klaviyo Developer Docs — Campaigns API overview, Create Campaign, Assign Template to Campaign Message, Create Campaign Send Job, `send_strategy` methods.
- ICO — PECR electronic-mail marketing rules, soft opt-in, sender identity + unsubscribe; UK GDPR Art 4(11) consent definition.

One claim was refuted and excluded: that a 0.05% complaint rate triggers Gmail/Yahoo bad-sender treatment — rely only on Klaviyo's <0.01% floor.

8 • What's built vs. pending

Built and ready: - 12 HTML templates (4 editorial · 8 commercial), link-checked clean against the live store. - `scripts/klaviyo.py` — full draft/schedule toolkit ported from Aster (Purry sender, hard `send_guard()`). Functions defined; none called. - This plan + the June calendar + the 90-day audit.

Pending (needs a go): - Create the `engaged_30d` (then `60d / 90d`) segment(s). - Build the staging driver; stage the remaining drafts in Klaviyo for review. - Suppress prior bounce/unsub/complaint profiles before any send. - VIP send: write the template once the exclusive code is decided. - Schedule each draft (Phase 2) — explicit human go, per send, on the \$5 ladder.

Drafts only. Akshit reviews every campaign in the Klaviyo UI and clicks Send. Nothing in this plan sends email autonomously.
